

Valida My Care Choices Register

Single Record for Care Choices across the Healthcare System, Paperless, Managing Consent and Sharing Seamlessly

Patient preferences and care choices are relevant at all stages of an illness. In the past this has been delivered via different registers. Valida My Care Choices Register is designed to provide an all-encompassing register for the recording of patient choices. In this way, data is captured about decisions relevant to the person at the right time. Some decisions may be relevant to all situations, whilst others may only need to be considered in the context of life limiting illness.

By having one overarching register the patient and their families as well as clinicians can become familiar with the concept of recording choices earlier in their illness allowing an ongoing discussion about priorities as their condition changes over time.

- Valida My Care Choices Register (MCCR) is an EPaCCS giving the whole care team access to a single updated record of patient choices
- Integrated with GP systems, with read access to patient records
- Available to care settings including hospital, out of hours, hospice and emergency care
- Consent managed and data sharing controlled according to patient choice
- Reporting and audit available for management of patient groups
- Used for end-of-life patients, but available for other patient groups
